

Django Templates Setup

Tutorial #10: Project-Level Templates Folder Configuration (Hinglish Notes)

1. MVT Architecture Kya Hota Hai?

Django mainly **MVT Architecture** par kaam karta hai jo web apps ko clean aur manageable banata hai:

Model (M)

Database se juda saara kaam, tables aur queries handle karta hai.

View (V)

Business logic ko sambhalta hai aur request ko process karta hai.

Template (T)

Yeh **Frontend / UI** hai jo user ko browser par dikhta hai (HTML, CSS aur design).

2. Template Ki Zarurat Kyon Padi?

- Agar hum `views.py` ke andar hi

`ya`

`tags` likhne lagenge, toh sirf 1-2 line hi handle ho paayengi.

- Real-world websites ke HTML pages hazaaron lines ke hote hain, jise views mein likhna impossible hai.
- Isliye **Templates** ka use hota hai, jahan hum proper aur clean HTML files alag folder mein likhte hain.

3. Templates Folder Ke 2 Tarike (Types)

- App-Level Template:** Har ek individual App ka apna khud ka template folder hota hai.
- Project-Level Template:** Yeh ek **Centralized** folder hota hai jo pure project ke liye common hota hai, jise sabhi apps use kar sakte hain!

4. Project-Level Template Setup (Step-by-Step)

Step 1 & 2: Project & Folder Banao

```
django-admin startproject myproject3 cd myproject3 # Root folder mein ek 'templates' folder banao aur uske andar 'home.html' rakho
```

Step 3: `settings.py` Mein Path Set Karo

```
import os # 🖱️ File ke bilkul upar ye import karna mat bhoolna TEMPLATES = [ { ... 'DIRS': [os.path.join(BASE_DIR, 'templates')], # 🖱️ Path set kiya ... }, ]
```

Step 4 & 5: View aur URL Map Karo

```
# views.py from django.shortcuts import render def home(request): return render(request, 'home.html') # 🖱️ templates/home.html render karega # urls.py from django.urls import path from . import views urlpatterns = [ path("", views.home, name='home'), ]
```

Step 6 & 7: HTML Code & Server Run

```
<!DOCTYPE html> <html> <body> <h1 style="color: red;">Hello World!</h1> <p>This is my first project templates setup</p> </body> </html>
```

Terminal mein run karo: `python manage.py runserver` aur browser mein <http://127.0.0.1:8000/> open karo!
