

Django Tutorial #20

Building a Complete Portfolio Website | Notes in Hinglish

 **Project Overview:** Is project (My Portfolio Website) mein hum ab tak seekhe gaye saare concepts revise karenge. Hum **Static Pages** (Home, About, Contact), **Template Inheritance**, aur **Static Files** (CSS, Images) ko ek real-world project mein integrate karna seekhenge.

1. Project & App Creation

Sabse pehle VS Code terminal open karein aur apna naya project aur app create karein:

Terminal

```
django-admin startproject myproject12 cd myproject12 python manage.py  
startapp portfolio
```

2. settings.py Configuration

myproject12/settings.py mein humein app ko register karna hai, aur templates/static files ke paths set karne hain.

- **App Register karein:** INSTALLED_APPS list mein 'portfolio' add karein.
- **Templates Folder:** Root folder (myproject12 level) par ek templates folder banayein aur use configure karein.
- **Static Folder:** Root folder par ek static folder banayein.

settings.py (Updates)

```
INSTALLED_APPS = [ ... 'portfolio', ] TEMPLATES = [ { 'DIRS': [BASE_DIR /  
'templates'], # Template directory setup ... } ] STATICFILES_DIRS = [ BASE_DIR /  
'static' # Static files setup ]
```

3. URLs Setup (Routing)

Humein project ke main `urls.py` ko app ke `urls.py` se connect karna hai (Include method ka use karke).

myproject12/urls.py (Main)

```
from django.contrib import admin from django.urls import path, include
urlpatterns = [ path('admin/', admin.site.urls), path('',
include('portfolio.urls')), # App urls include kar di ]
```

Ab portfolio app ke andar ek nayi file `urls.py` banayein aur wahan home, about, aur contact ke paths define karein:

portfolio/urls.py (App)

```
from django.urls import path from . import views urlpatterns = [ path('',
views.home, name='home'), path('about/', views.about, name='about'),
path('contact/', views.contact, name='contact'), ]
```

4. Views Setup

portfolio/views.py file mein jaakar in teeno routes ke liye function banayein jo specific HTML files render karenge.

portfolio/views.py

```
from django.shortcuts import render def home(request): return render(request,
'home.html') def about(request): return render(request, 'about.html') def
contact(request): return render(request, 'contact.html')
```

5. Templates & Static Folders Structure

Apne project ke root par templates aur static folders banayein aur unhe is tarah structure karein:

- **templates/**
 - `base.html` (Master template)
 - `home.html`, `about.html`, `contact.html`
 - **includes/** (Naya folder components ke liye)
 - `navbar.html`, `footer.html`
- **static/**
 - **css/** -> `style.css` (Yahan apni CSS daalein)
 - **images/** -> (Hero image, logos, project thumbnails)

6. Master Template (base.html)

Ye file hamari website ka skeleton banegi. Isme hum apna CSS link karenge aur dynamic content ke liye blocks define karenge.

templates/base.html

```
<!DOCTYPE html> <html lang="en"> <head> {% load static %} <title>My
Portfolio</title> <link rel="stylesheet" href="{% static 'css/style.css' %}">
</head> <body> <!-- Navbar ko include kiya --> {% include 'includes/navbar.html' %}
<main> <!-- Yahan baaki pages ka data aayega --> {% block content %} {% endblock %}
</main> <!-- Footer ko include kiya --> {% include 'includes/footer.html' %}
</body> </html>
```

7. Child Templates (Home, About, Contact)

Ab hum baaki pages banayenge jo `base.html` ko extend karenge.

templates/home.html

```
{% extends 'base.html' %} {% load static %} {% block content %} <section
class="hero">...</section> <section class="projects"> <h2>Featured Projects</h2>
<div class="project-grid"> <!-- Project 1 -->  <h3>Portfolio Website</h3> </div>
</section> {% endblock %}
```

templates/contact.html (Form Example)

```
{% extends 'base.html' %} {% block content %} <section class="contact">
<h1>Contact Me</h1> <form method="POST"> {% csrf_token %} <!-- MUST FOR SECURITY --
> <input type="text" name="name" placeholder="Your Name" required> <input
type="email" name="email" placeholder="Your Email" required> <textarea
name="message"></textarea> <button type="submit">Send Message</button> </form>
</section> {% endblock %}
```

Security Pro-Tip: `{% csrf_token %}`

Jab bhi aap Django mein POST form banayein, `{% csrf_token %}` lagana zaroori hai. Iske bina Django form ko reject kar dega (Cross-Site Request Forgery protection ki wajah se).

8. Header (Navbar) & Footer

In files mein sirf apna HTML component likhein. Django inhe `include` block ke zariye apne aap inject kar dega.

- `navbar.html` mein logo (static tag use karke) aur Navigation Links (Home, About, Contact) daalein.
- `footer.html` mein Copyright text likhein.
- End mein `python manage.py runserver` run karein aur apni perfect portfolio website enjoy karein!
