

Django Tutorial #11 - App Level Templates Setup

Quick Revision Notes | Hinglish Guide for Multi-App Template Integration

📌 **Overview:** Is lecture mein humne sekha ki kaise ek Django project ke andar **multiple apps** (jaise **Blog** aur **Shop**) banakar unke andar individual templates (HTML files) setup kiye jaate hain aur unhe project ke sath link karte hain.

Step 1: Project & Apps Create Karna

Sabse pehle humne terminal mein ek main project banaya aur uske andar do independent apps (**blog** aur **shop**) setup kiye:

```
# 1. Main Project Create Karein django-admin startproject myproject4 cd myproject4 # 2. Do Apps Create Karein python3 manage.py startapp blog python3 manage.py startapp shop
```

Step 2: settings.py mein Apps Register Karna

Project ki `settings.py` file mein jaakar `INSTALLED_APPS` list ke andar apni nayi apps add karni zaroori hain, warna Django error dega:

```
INSTALLED_APPS = [ # ... default apps ... 'blog', 'shop', ]
```

Step 3: Project-Level Templates Setup

Project ki root directory mein ek global templates folder banate hain aur uske andar base file rakhte hain:

- **Base Directory:** Django automatically `BASE_DIR` detect kar leta hai, alag se `os.path` import karne ki zaroorat nahi padti.
- **Folder Structure:** `myproject4/templates/base.html`

Step 4: App-Level Templates & Views Integration

Har app ke andar apna templates/app_name/ folder banate hain taaki Django templates ko easily identify kar sake:

Blog App Structure

blog/views.py mein function banaya:
render(request, 'blog/post_list.html')
Template path:
blog/templates/blog/post_list.html

Shop App Structure

shop/views.py mein function banaya:
render(request, 'shop/product_list.html')
Template path:
shop/templates/shop/product_list.html

Step 5: URL Configuration (Routing)

Main urls.py mein include() ka use karke dono apps ko route kiya, aur phir respective app folders ke andar urls.py banakar views se link kiya:

```
# Main urls.py from django.urls import path, include urlpatterns = [ path('blog/', include('blog.urls')), path('shop/', include('shop.urls')), ]
```

Quick Revision / Key Takeaways

- **INSTALLED_APPS:** Nayi app banate hi use settings mein register karna **must** hai.
- **Namespace Folder:** App ke templates folder ke andar app ke naam ka ek aur subfolder banana best practice hai (jaise templates/blog/) taaki naming conflicts na ho.
- **Server Run Command:** python3 manage.py runserver likhakar browser mein /blog/ ya /shop/ par output check kar sakte hain.
- **Next Preview:** Next lecture mein hum sekhenge ki kaise base template ko inherit karke baar-baar repetitive HTML code likhne se bacha ja sakta hai!
