

Django mein Tailwind CSS Setup

Channel: Mohit Decodes | **Topic:** Tailwind CDN aur CLI setup in Hindi/Hinglish

Is notes mein hum dekhenge ki ek Django project mein Tailwind CSS ko kaise integrate karte hain. Tailwind CSS use karne ke mainly 2 tarike hote hain:

- **Method 1: CDN (Content Delivery Network)** - Bahut easy hai, par sirf practice ya chhote projects ke liye theek hai.
- **Method 2: CLI (Command Line Interface)** - Ye production-ready tarika hai. Isme hum npm (Node Package Manager) ka use karke CSS ko compile karte hain.

Basic Django Setup (Pre-requisites)

Sabse pehle ek basic Django project aur app banate hain. Command prompt/terminal mein ye commands run karein:

```
# 1. Project banao django-admin startproject myproject cd myproject # 2.
App banao python manage.py startapp blog # 3. Virtual environment banao aur
activate karo python -m venv venv source venv/bin/activate # (Windows ke liye:
venv\Scripts\activate)
```

Settings configure karna: Apne settings.py mein INSTALLED_APPS ke andar 'blog' add karein. TEMPLATES ke DIRS mein template folder ka path dalei, aur Static files setup karein.

Method 1: CDN ke through Setup (Easy)

Agar aapko bina kisi complex setup ke bas turant Tailwind test karni hai, toh aap CDN link ka use kar sakte hain.

Steps:

1. Tailwind CSS ki official website par jao (Docs > Installation > Play CDN).
2. Waha se `<script>` tag copy karo.
3. Apne Django template (jaise base.html ya index.html) ke `<head>` section mein paste kar do.

```
<!-- HTML File ke head tag mein ye add karein --> <script
src="https://cdn.tailwindcss.com"></script>
```

Method 2: Tailwind CLI ke through Setup (Production Ready)

Ye best tarika hai Tailwind ko Django ke saath use karne ka. Iske liye aapke computer mein **Node.js** aur **npm** install hona chahiye (check karne ke liye `node -v` run karein).

Step 1: Tailwind CSS Install karna

Apne project folder (jahan `manage.py` hai) wahan terminal open karein aur ye command chalayein:

```
npm install tailwindcss
```

Isse aapke project mein `node_modules` aur `package.json` files ban jayengi.

Step 2: CSS Files Setup (Input & Output)

Ab hume ek input CSS file banani hai jisme hum Tailwind ke directives likhenge:

1. Apne blog app ke andar ek `static` folder banao.
2. Uske andar `src` folder banao aur ek nayi file create karo: `input.css` (Path: `blog/static/src/input.css`)
3. Is `input.css` file mein ye teen lines paste kar do:

```
@tailwind base; @tailwind components; @tailwind utilities;
```

Step 3: package.json mein Script likhna

Baar-baar lambi command type na karni pade, isliye hum ek shortcut (script) banayenge. `package.json` open karein aur "scripts" section mein "dev" script add karein:

```
"scripts": { "dev": "npx tailwindcss -i ./blog/static/src/input.css -o ./blog/static/src/output.css --watch" }
```

(Yaha `-i` matlab input file aur `-o` matlab output file. `--watch` ka matlab hai ki jaise hi aap file save karenge, Tailwind automatic nayi CSS generate kar dega.)

Step 4: Script run karna aur HTML mein link karna

Ab terminal mein script run karein:
